**PATH TRAVERSAL**

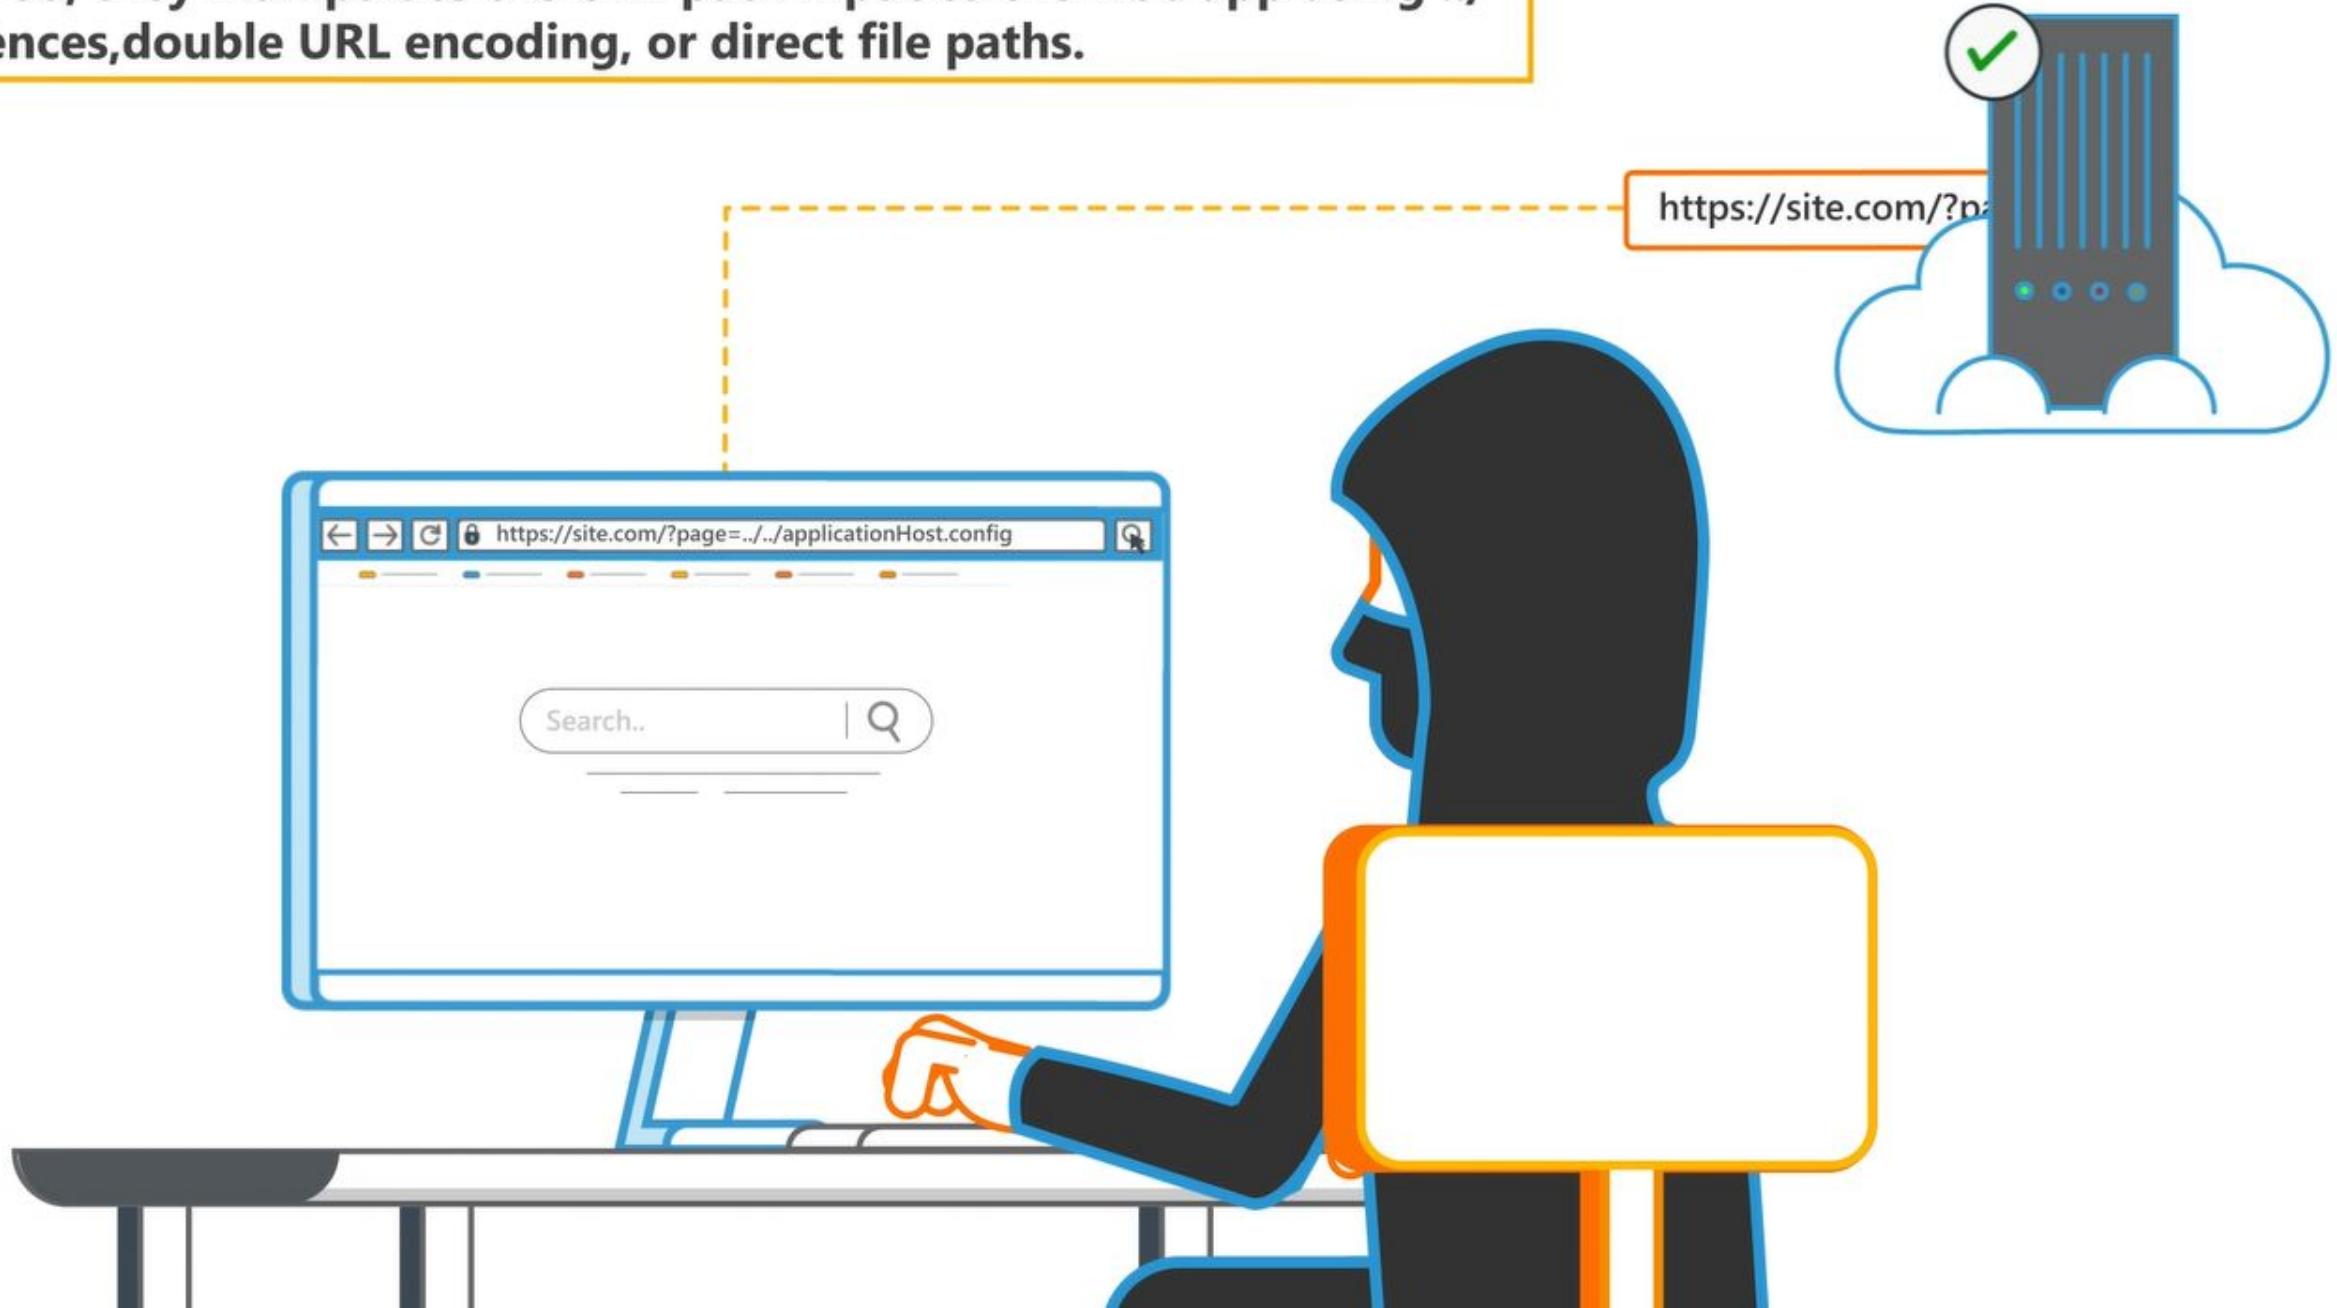

**We'll go through**

some causes and preventions of  
vulnerabilities in this category.

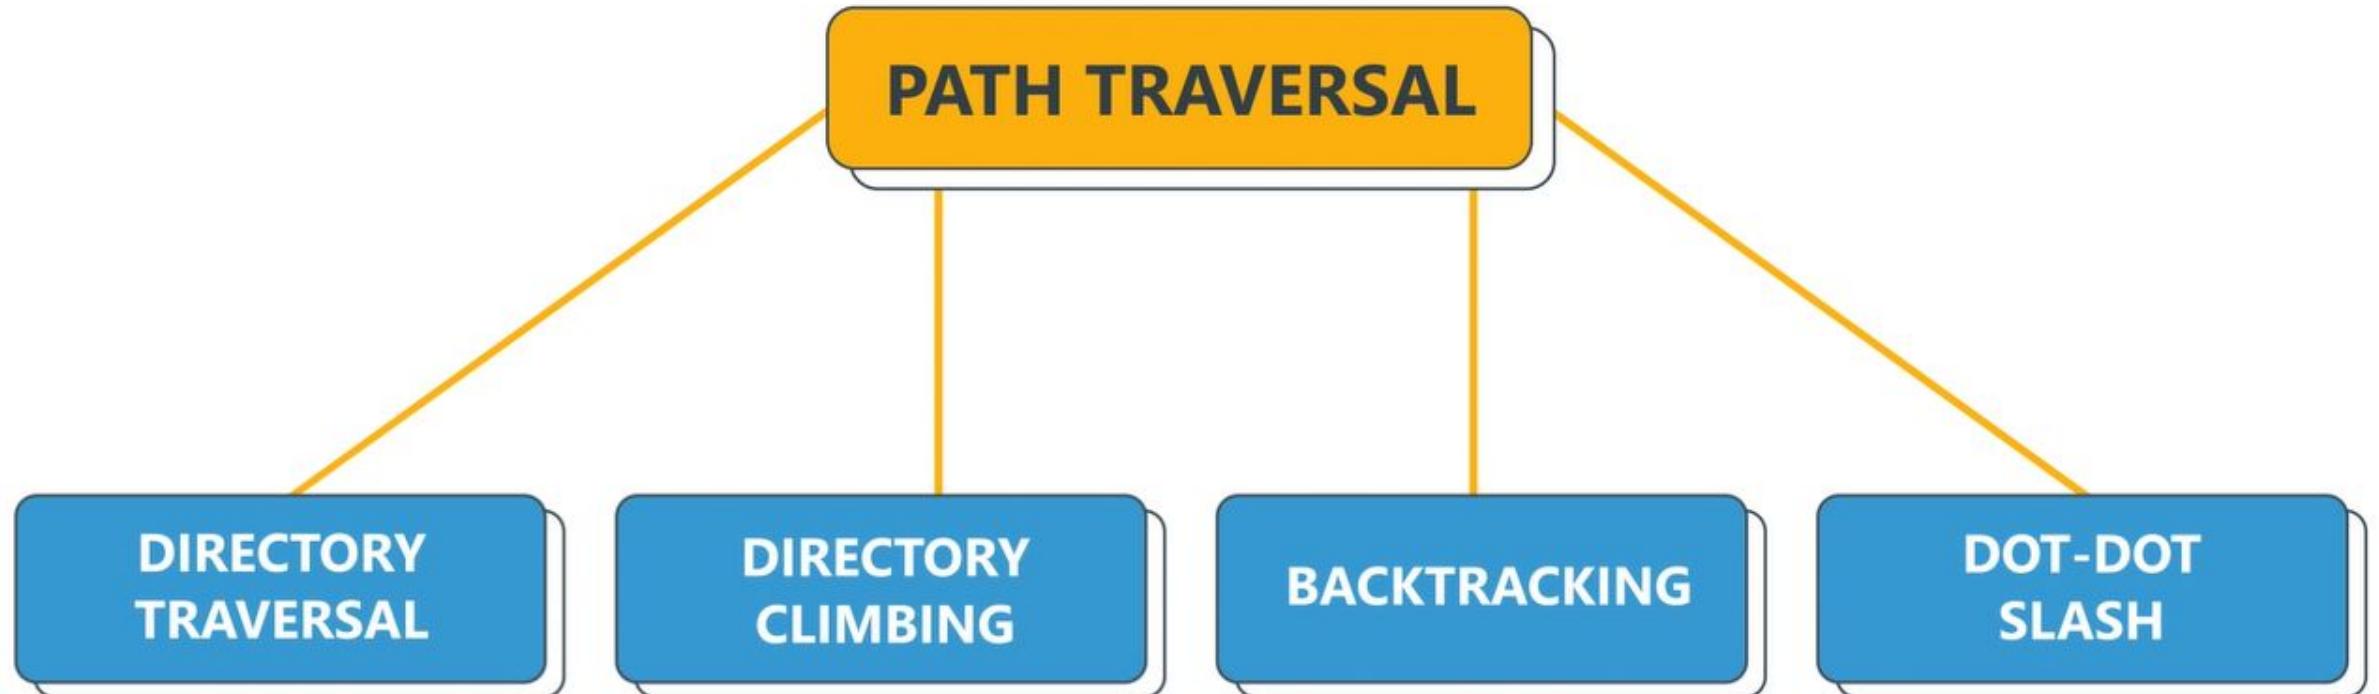

Attackers use path traversal to access files or directories stored in the file system of a web server or application, outside of the web root folder.

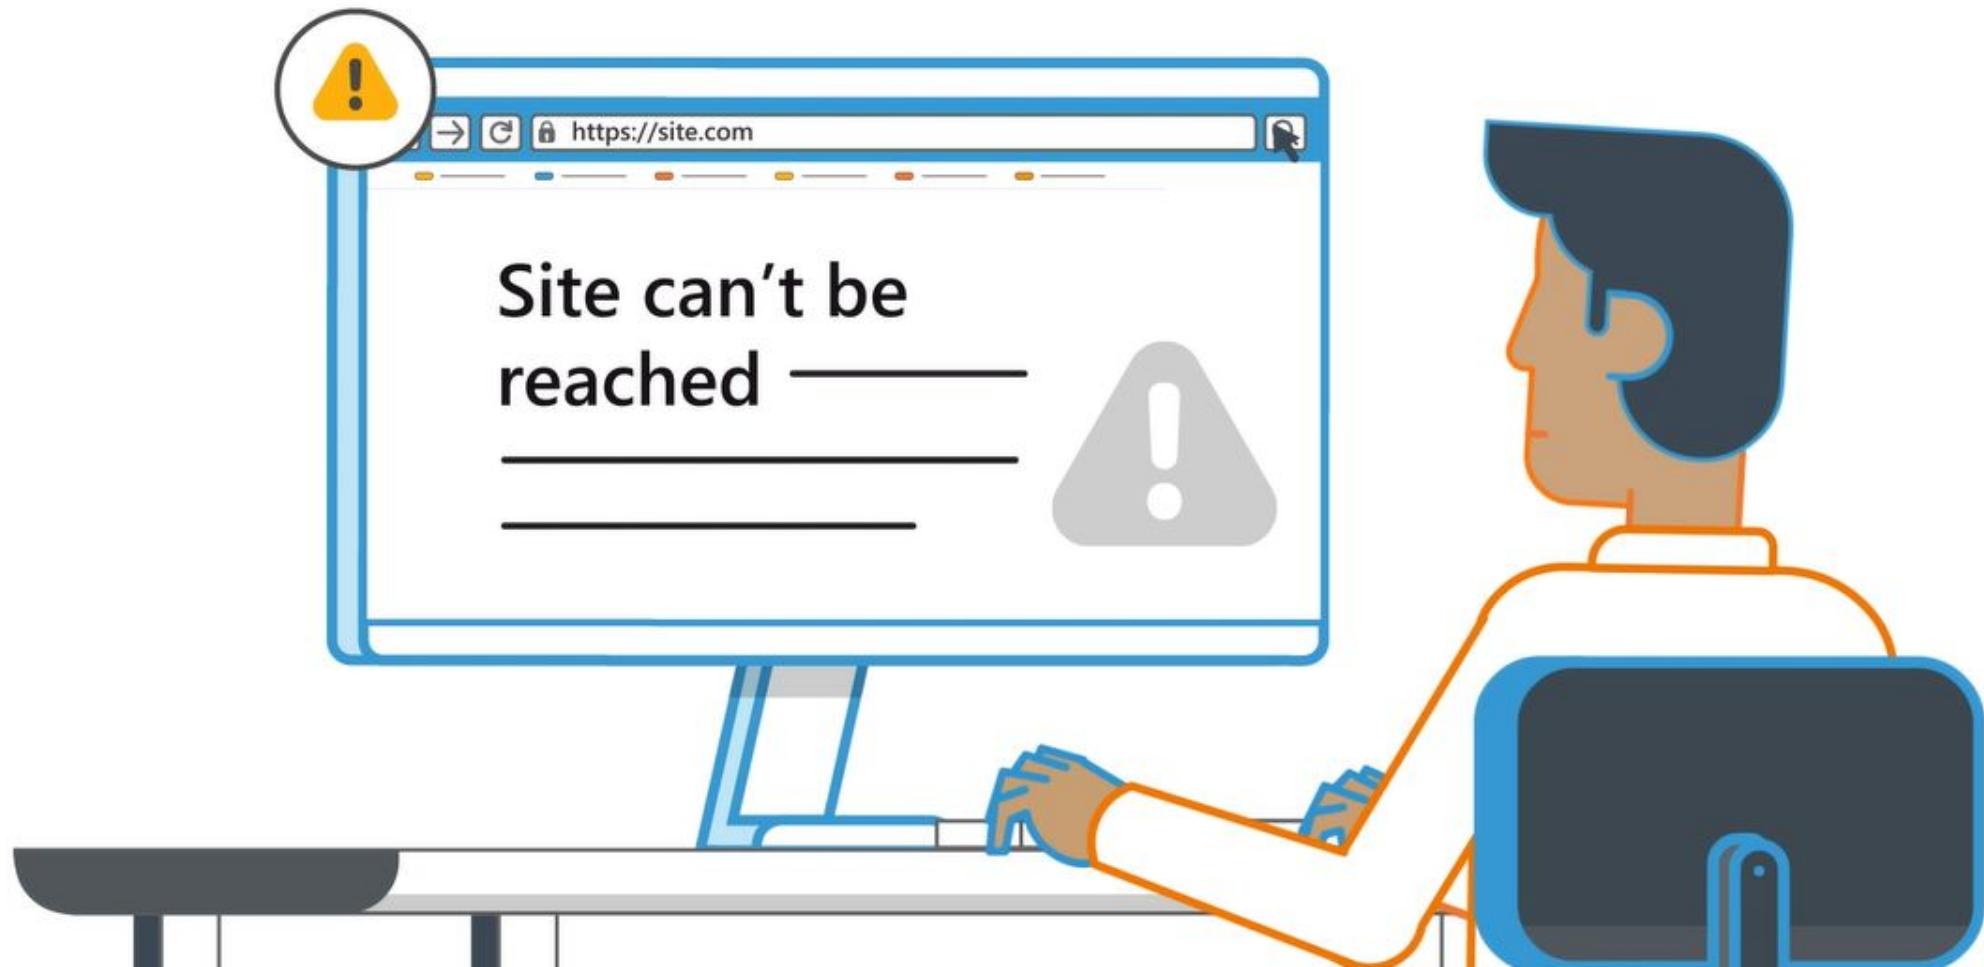

To do so, they manipulate the URL path input to the web app using ../  
sequences, double URL encoding, or direct file paths.

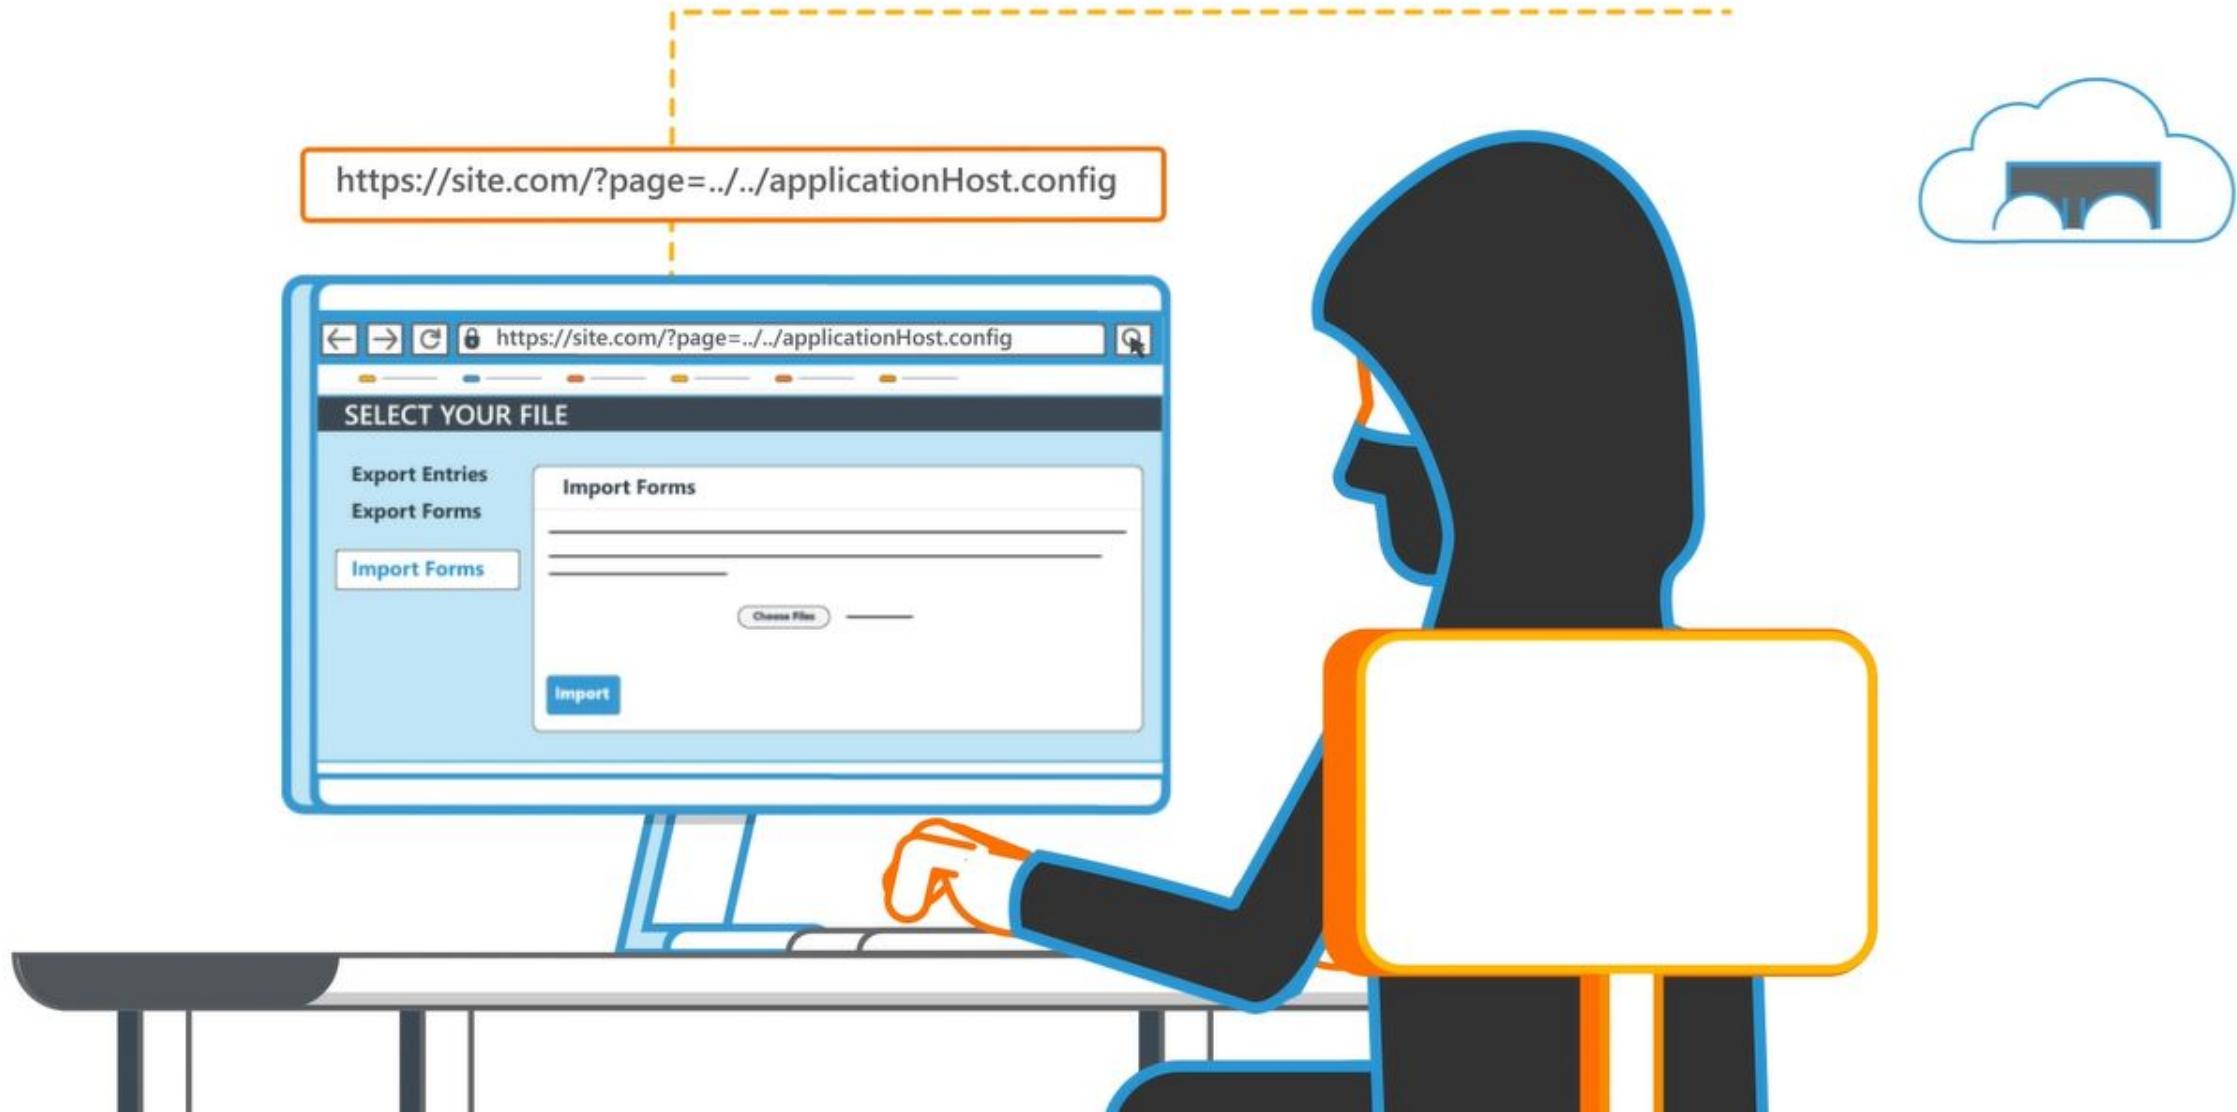

Path traversal is an attack with many names! It's also called directory traversal, directory climbing, backtracking, or, simply, dot-dot-slash.

Though most modern browsers have some level of built-in protection against basic path traversal attacks,

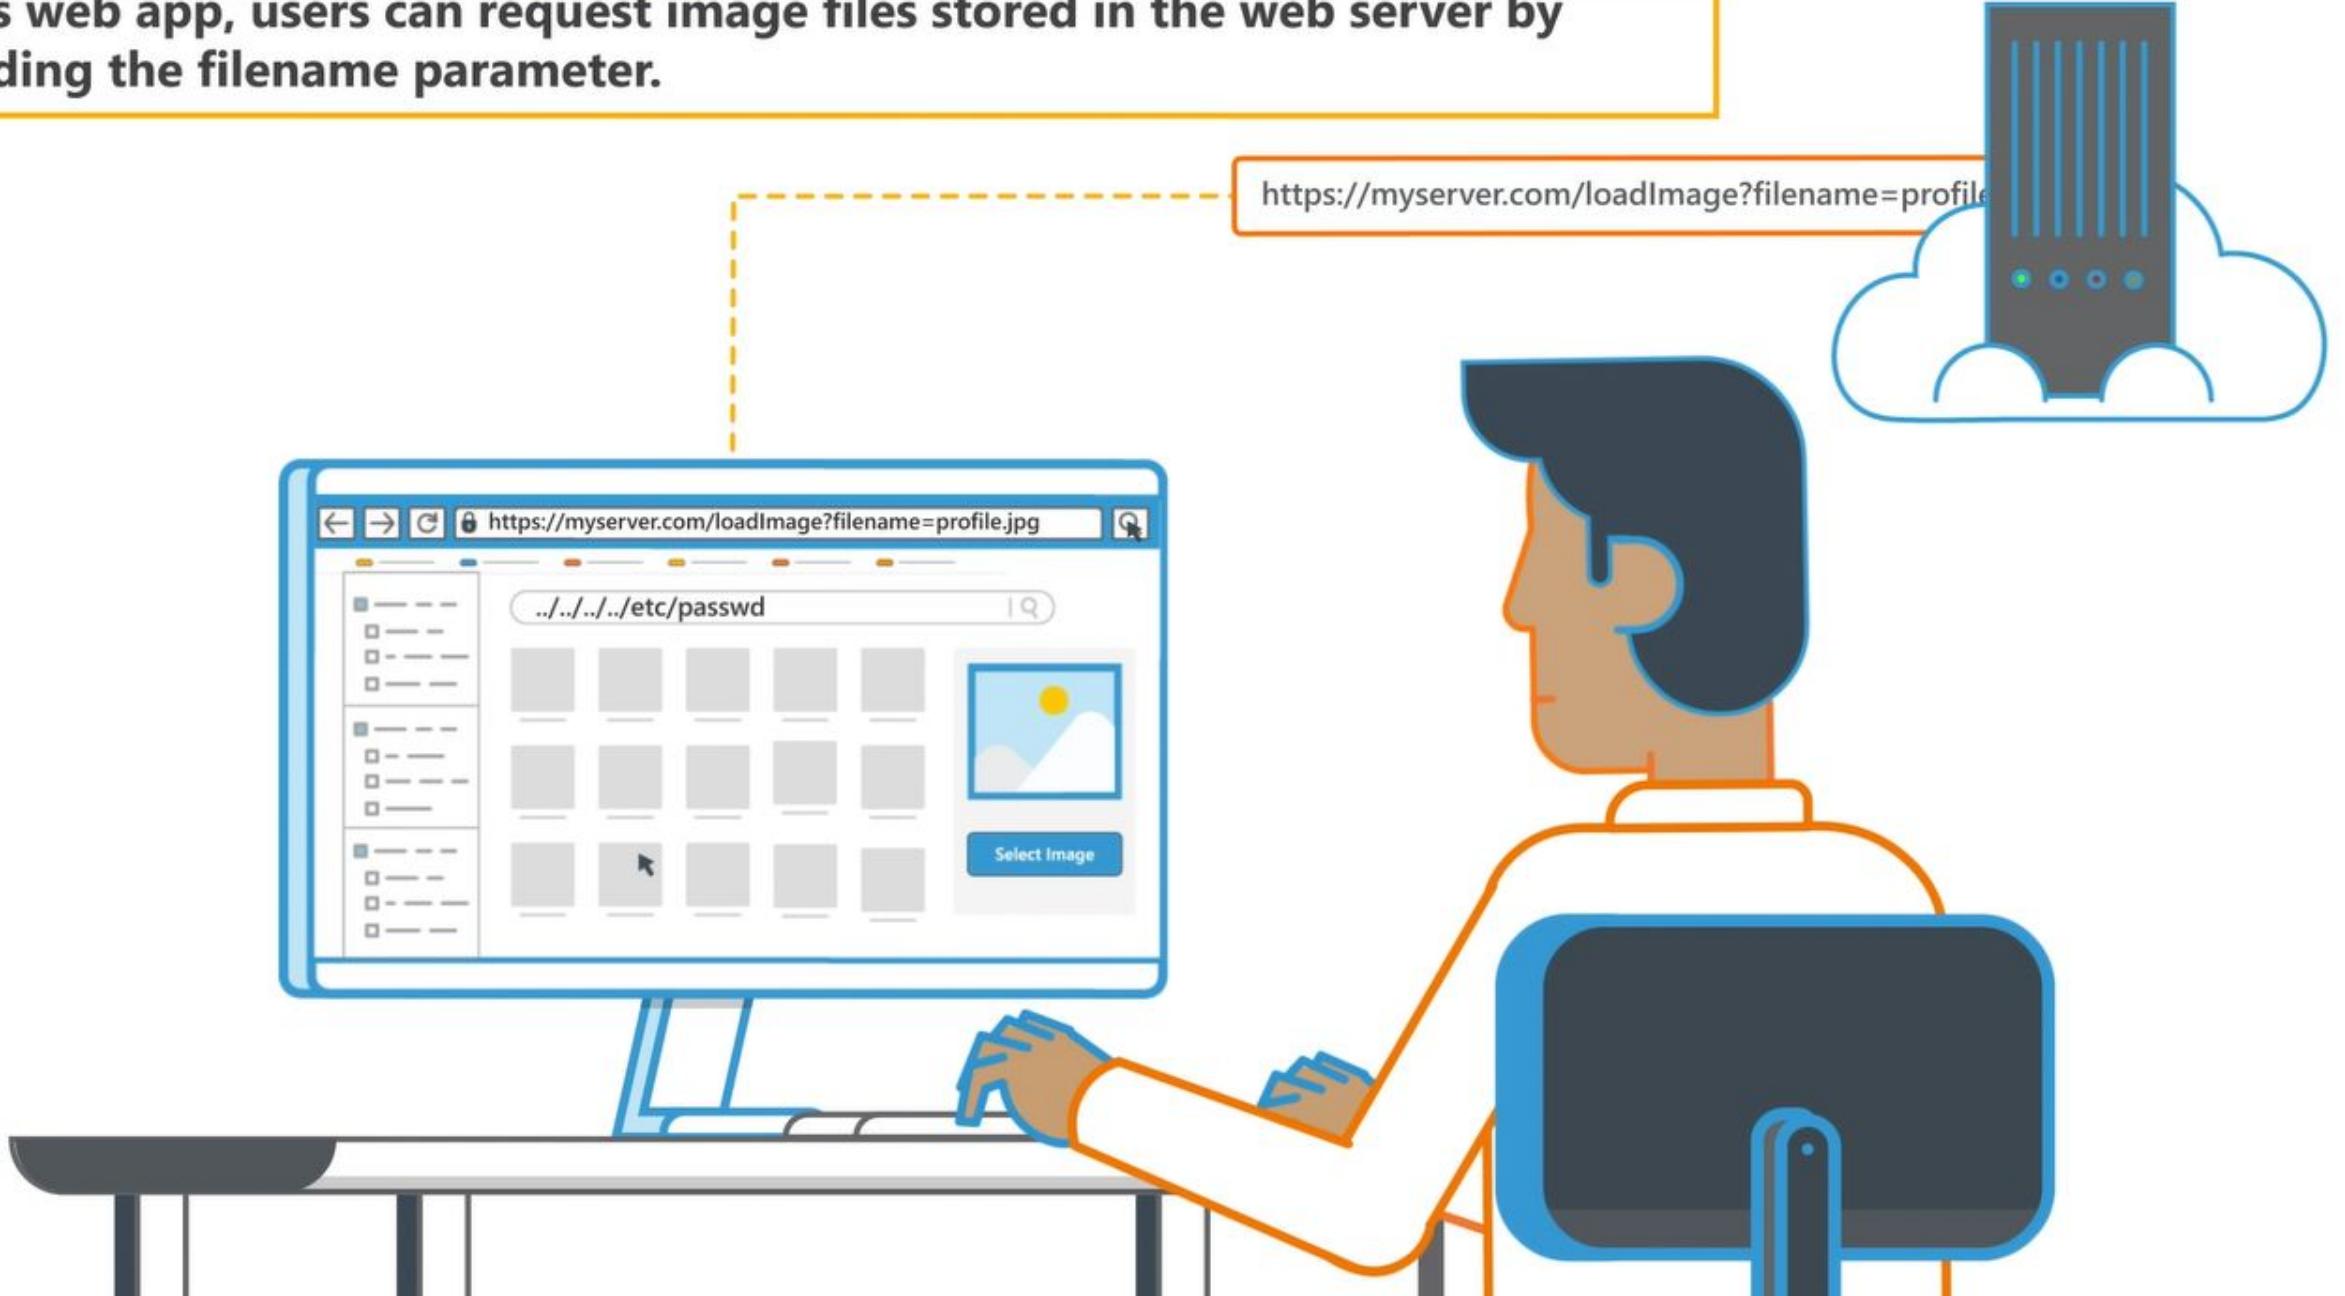

Attackers can still get by using variations of the dot-dot-slash technique.

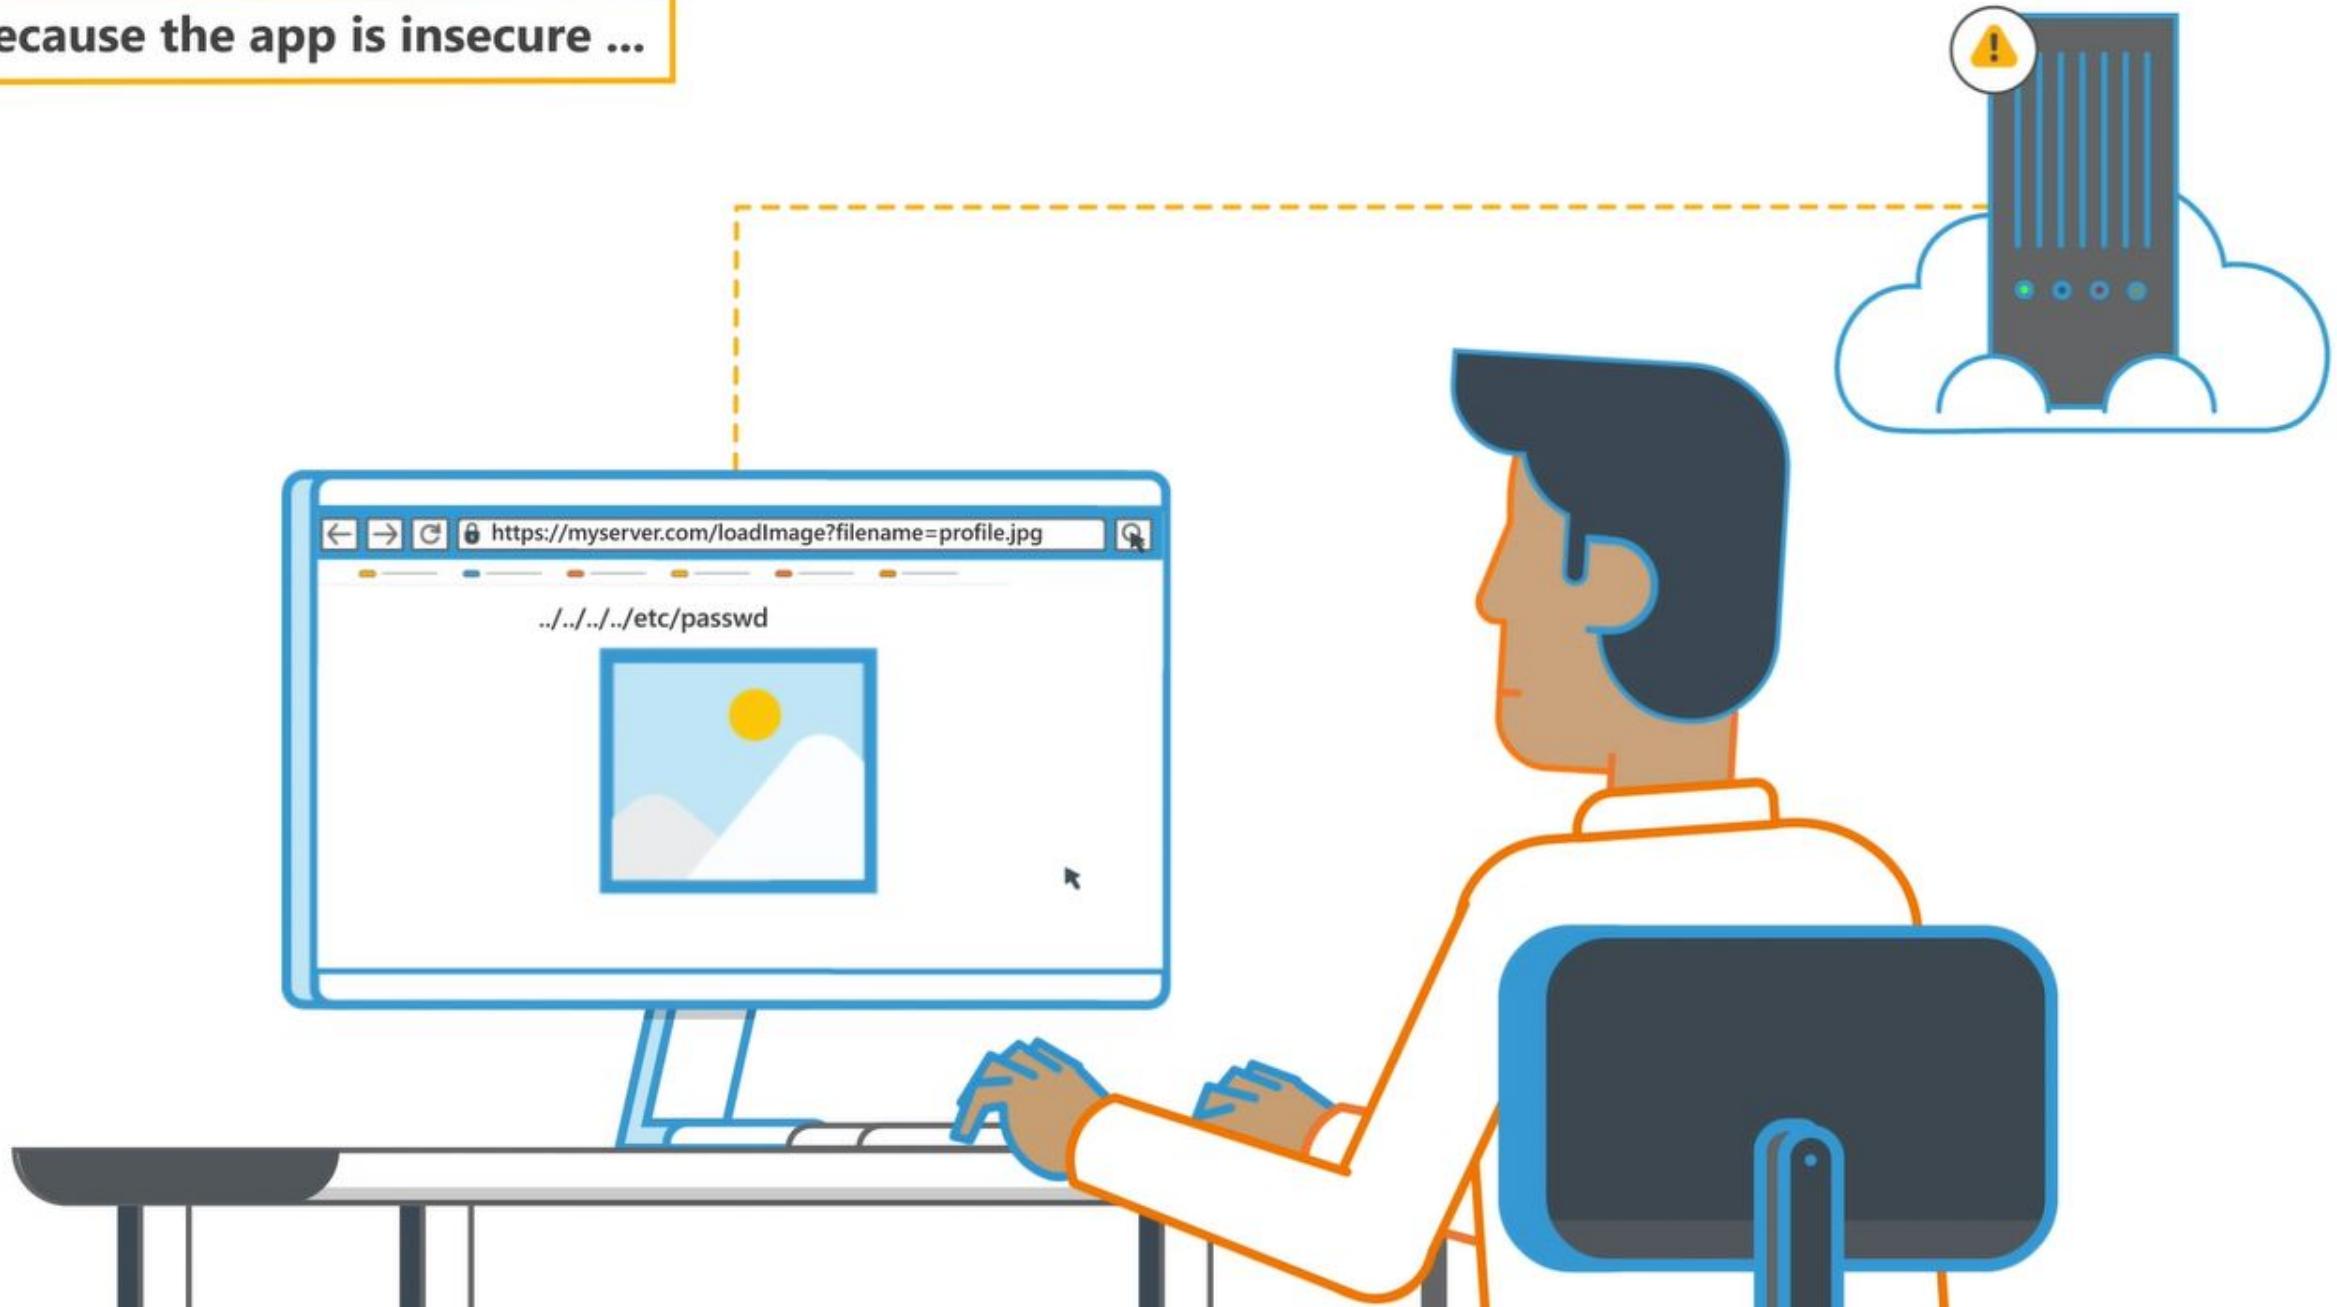

**To understand**

Path Traversal,  
let's look at an example

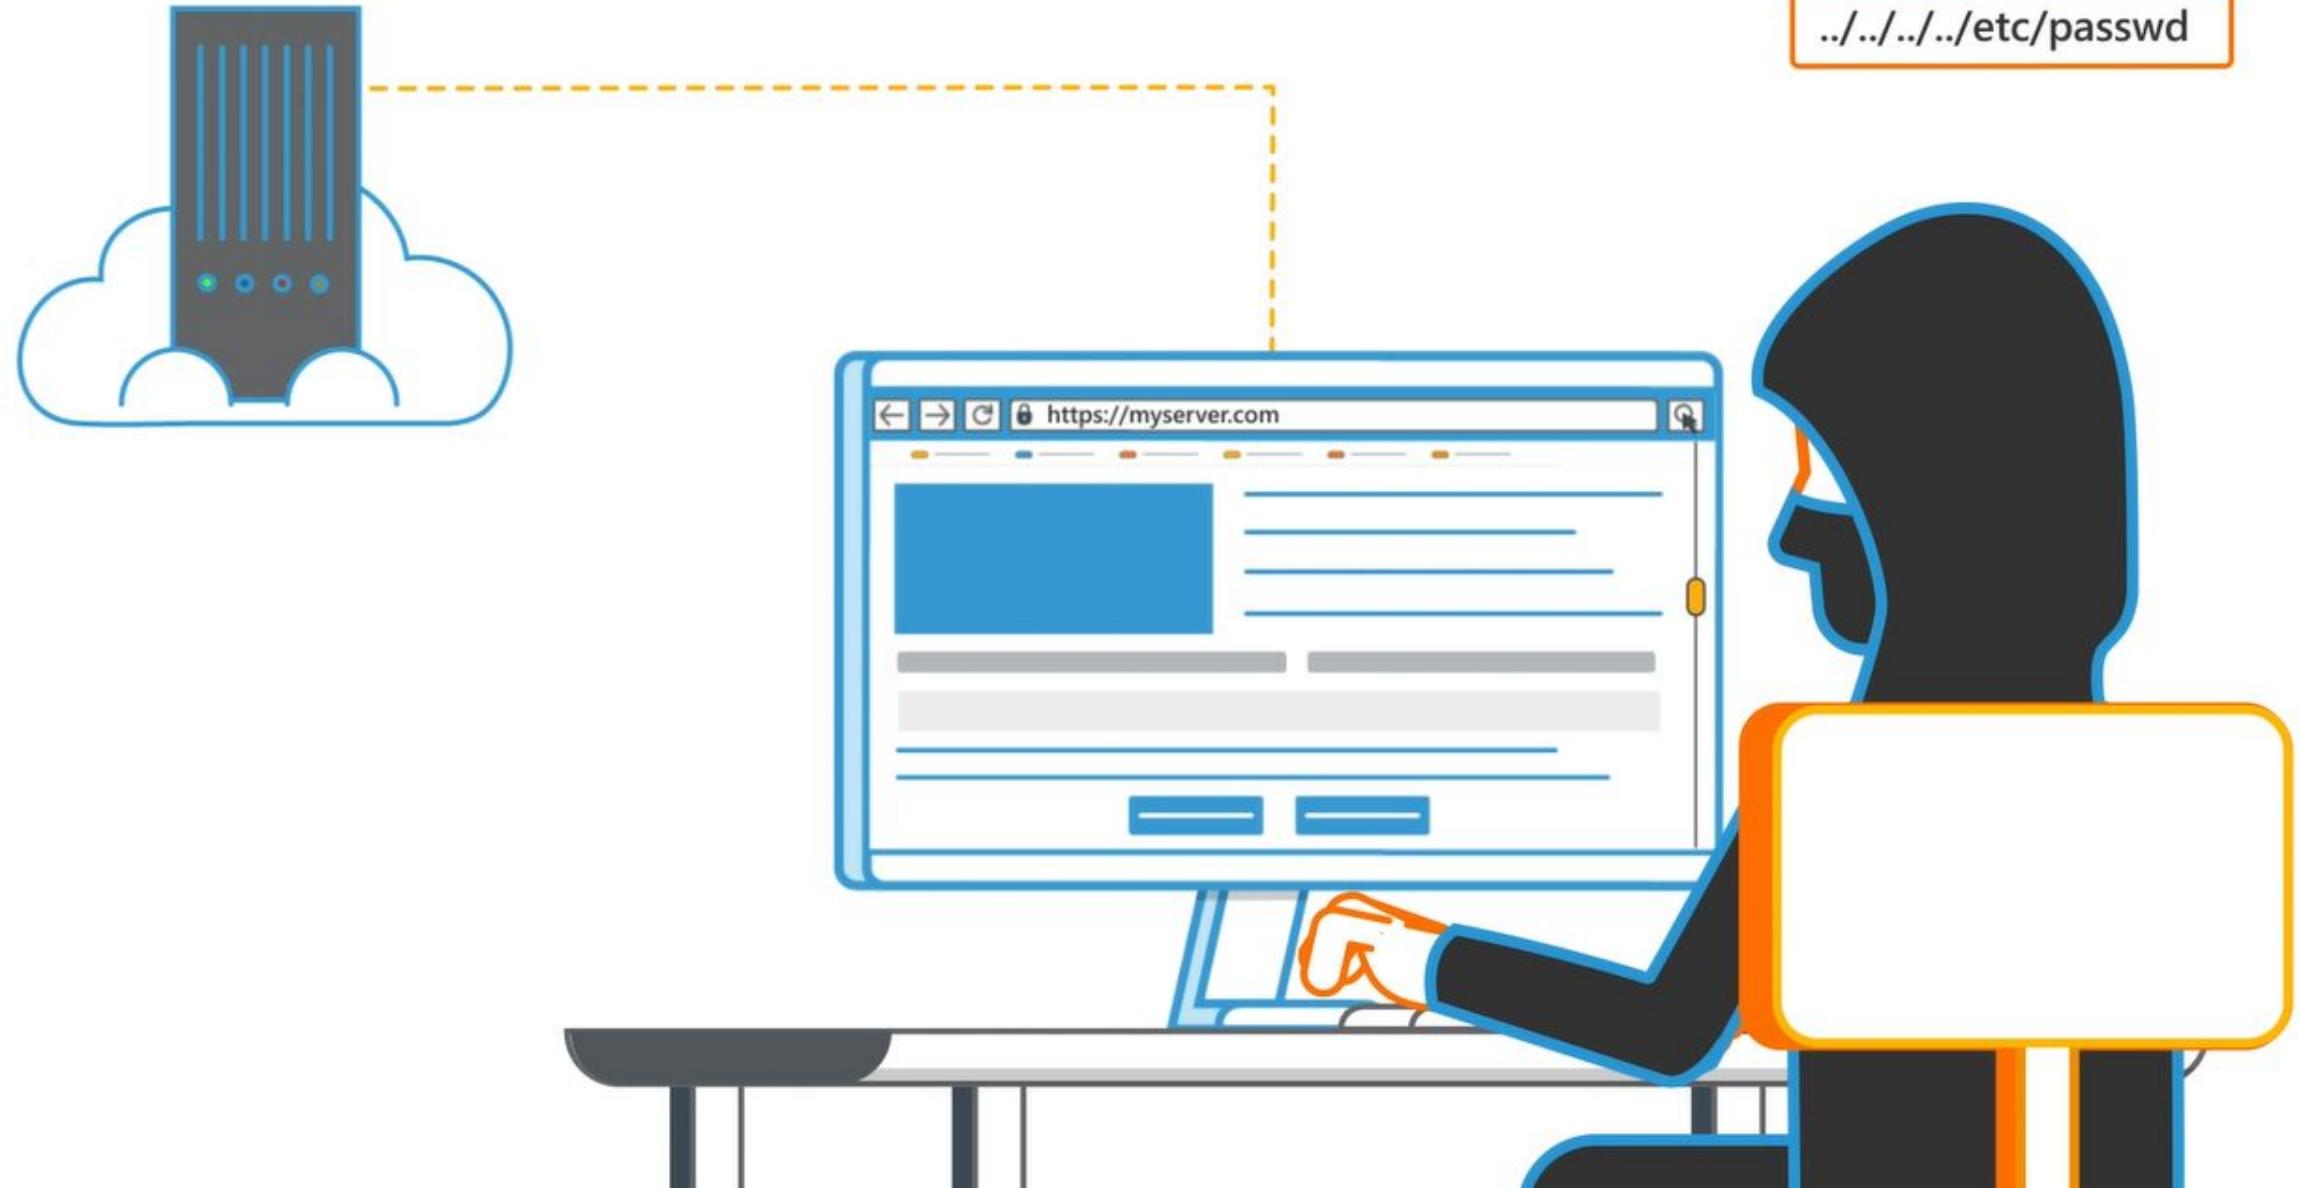

In this web app, users can request image files stored in the web server by providing the filename parameter.

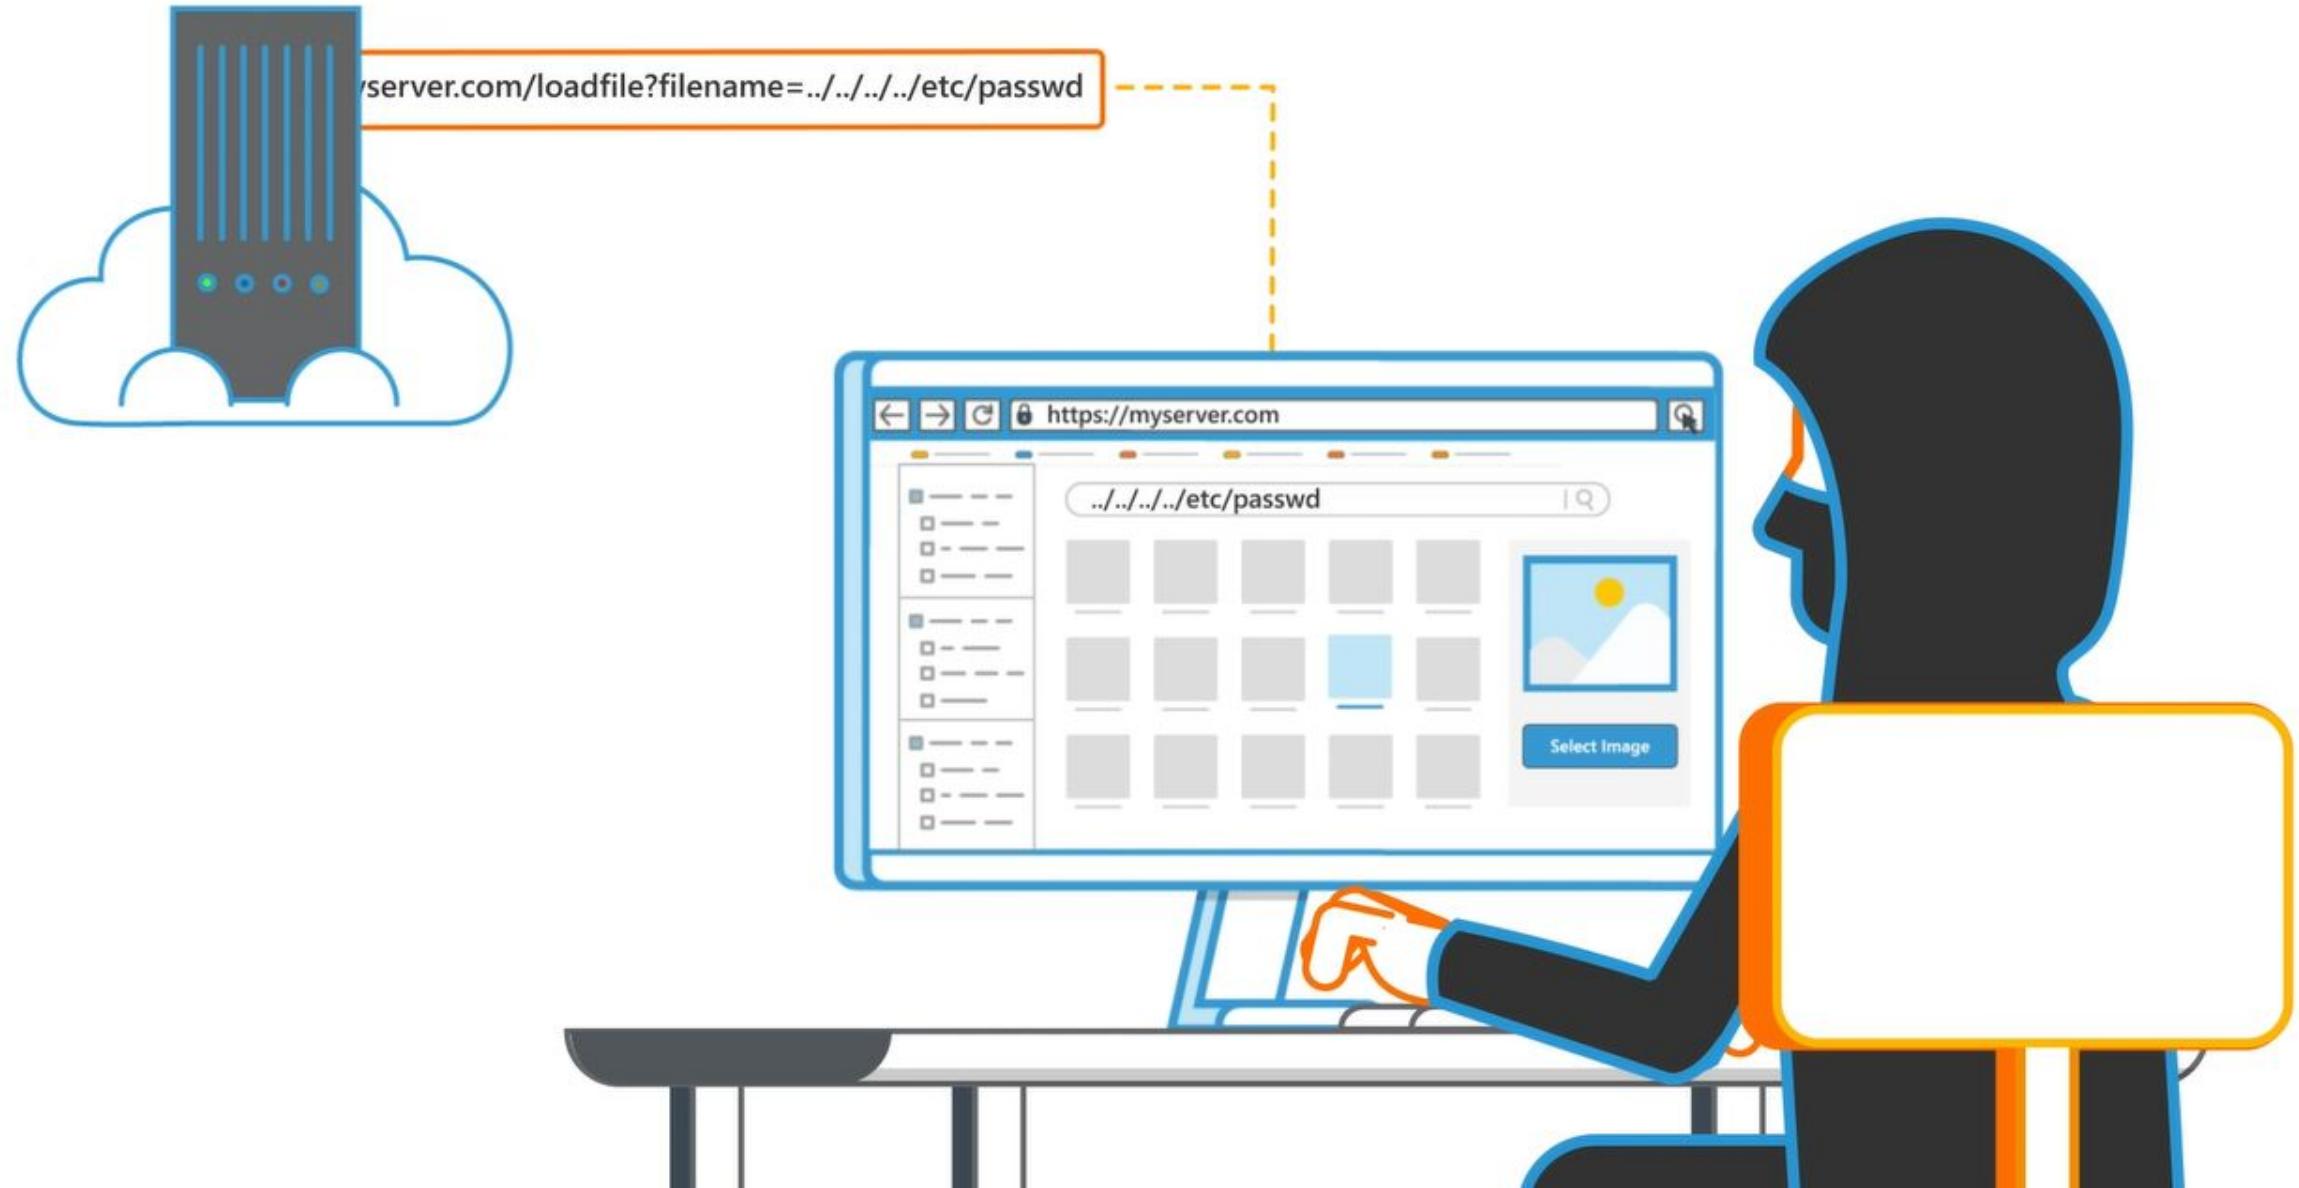

But because the app is insecure ...

**an attacker can enter an arbitrary file from the server's file system to access sensitive data.**

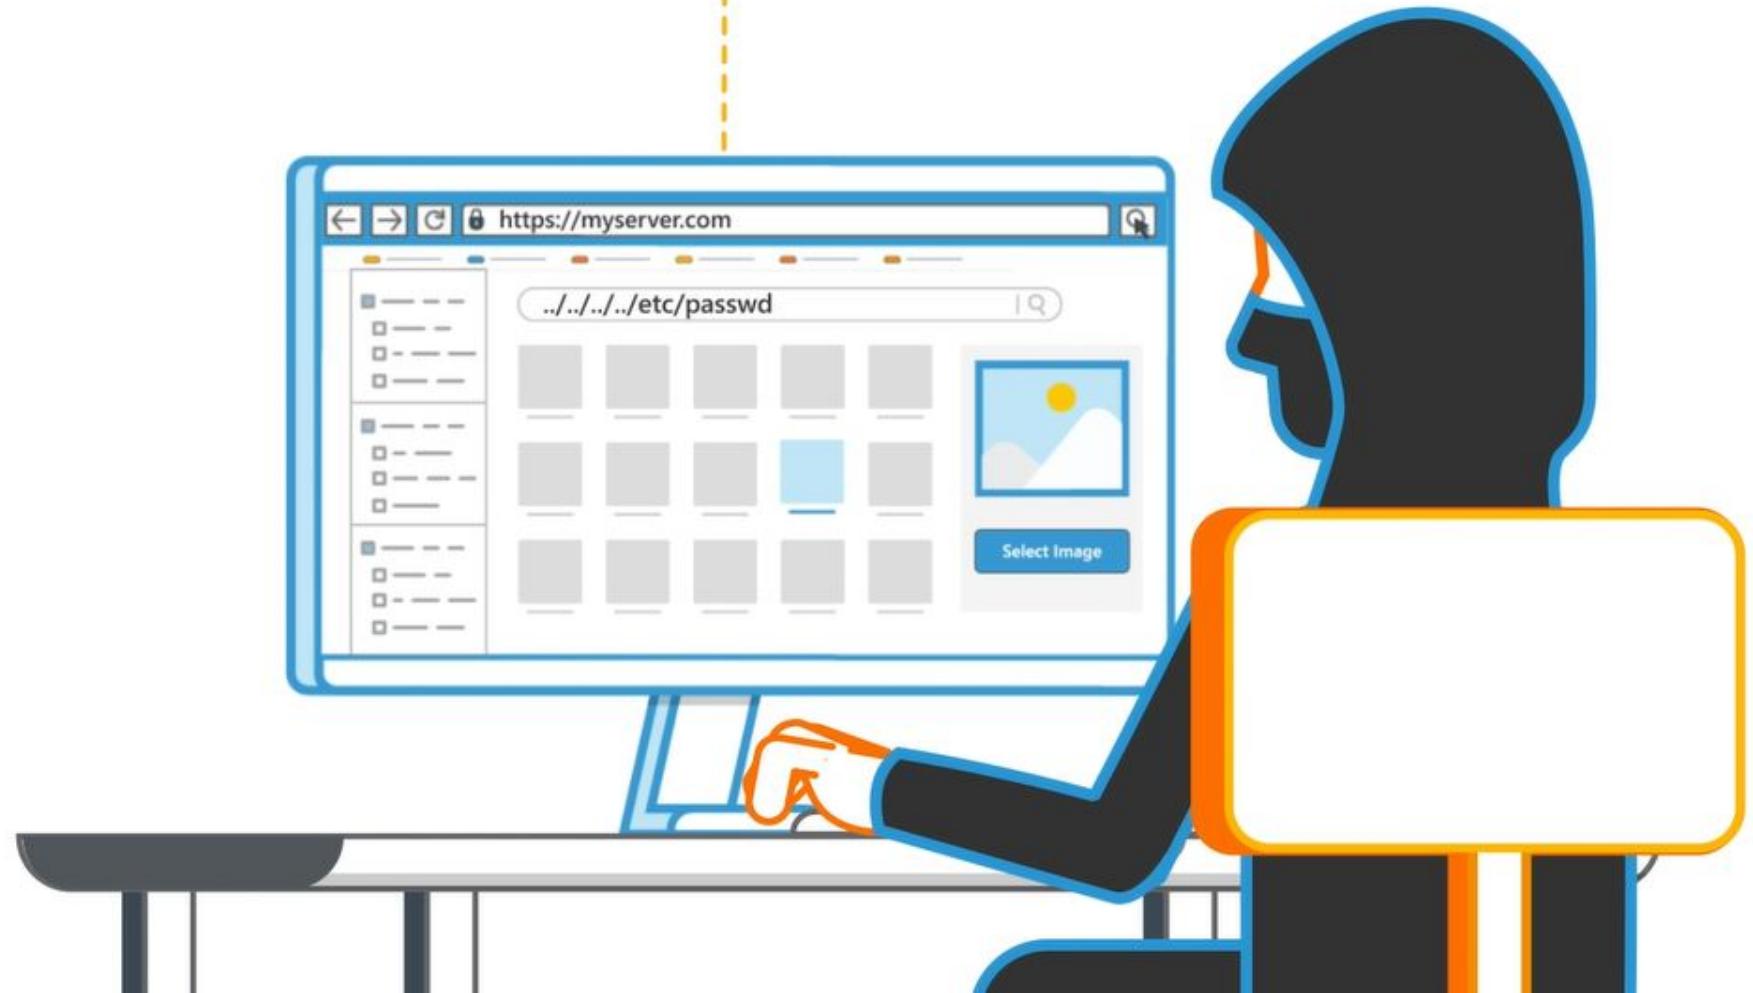

Here, the attacker uses a dot-dot-slash-etc-passwd file.

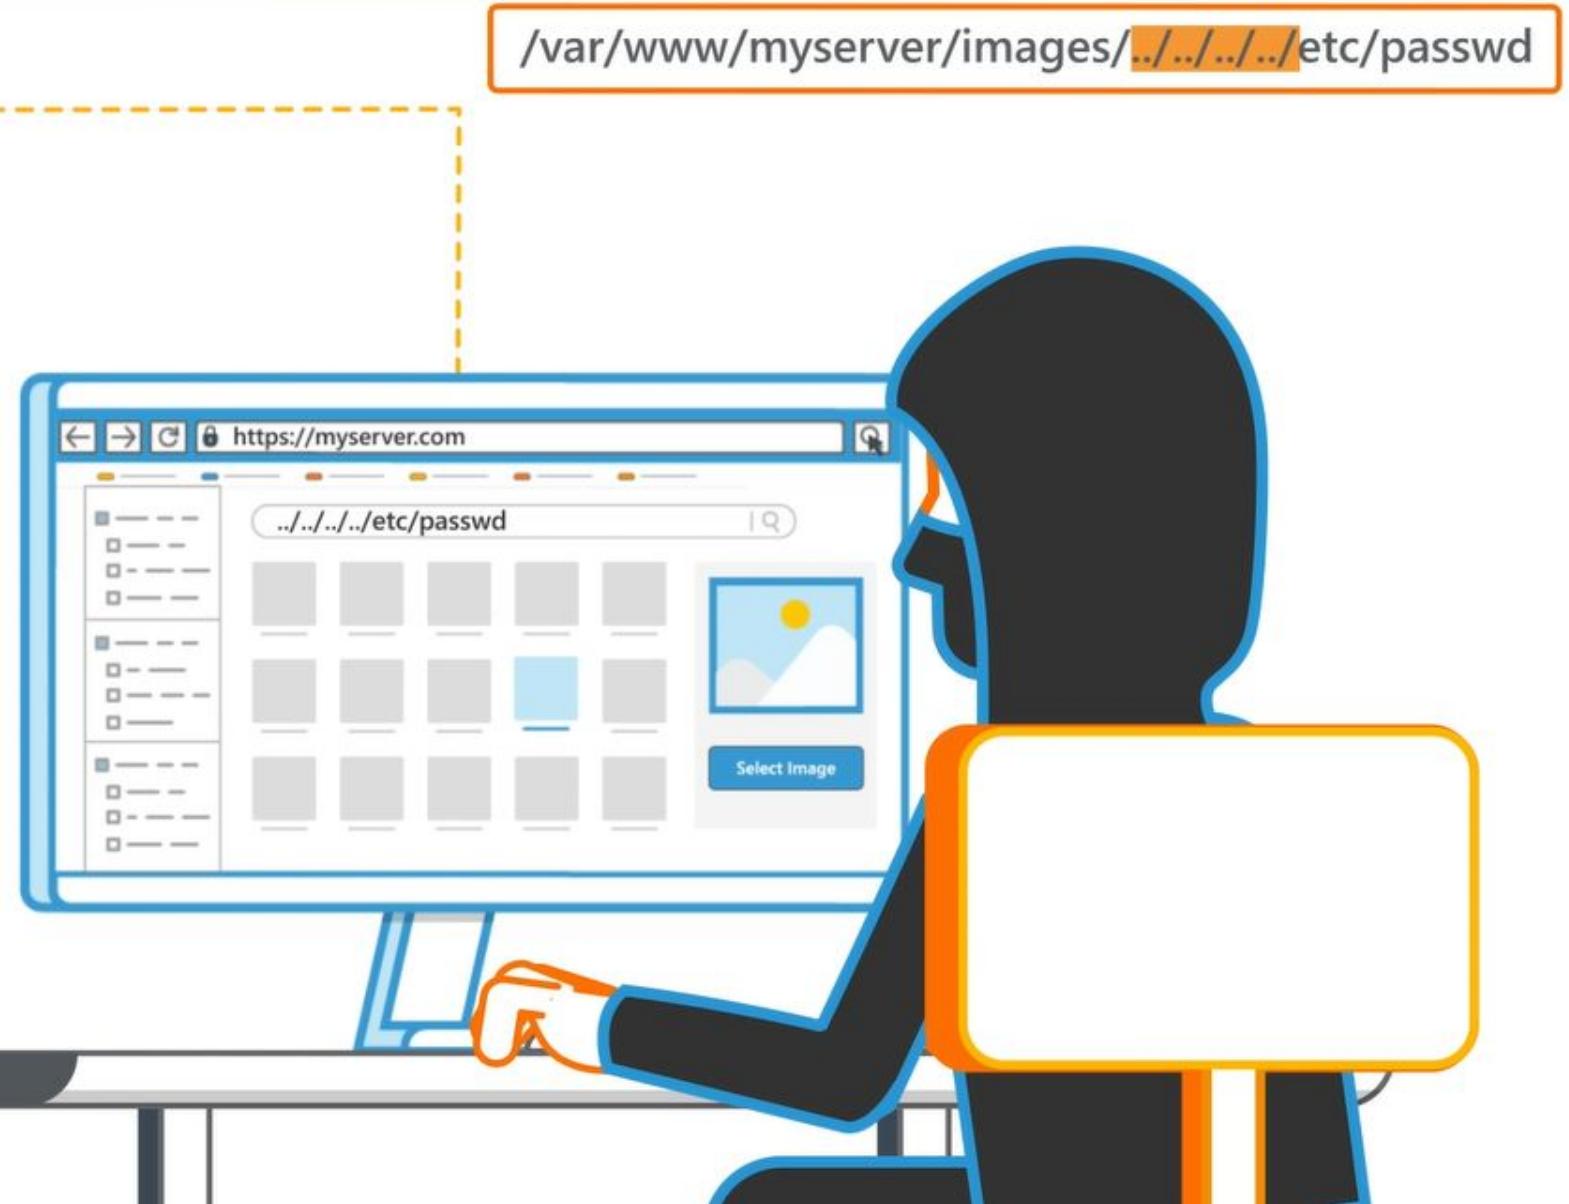

This causes the application to read from the following file path:

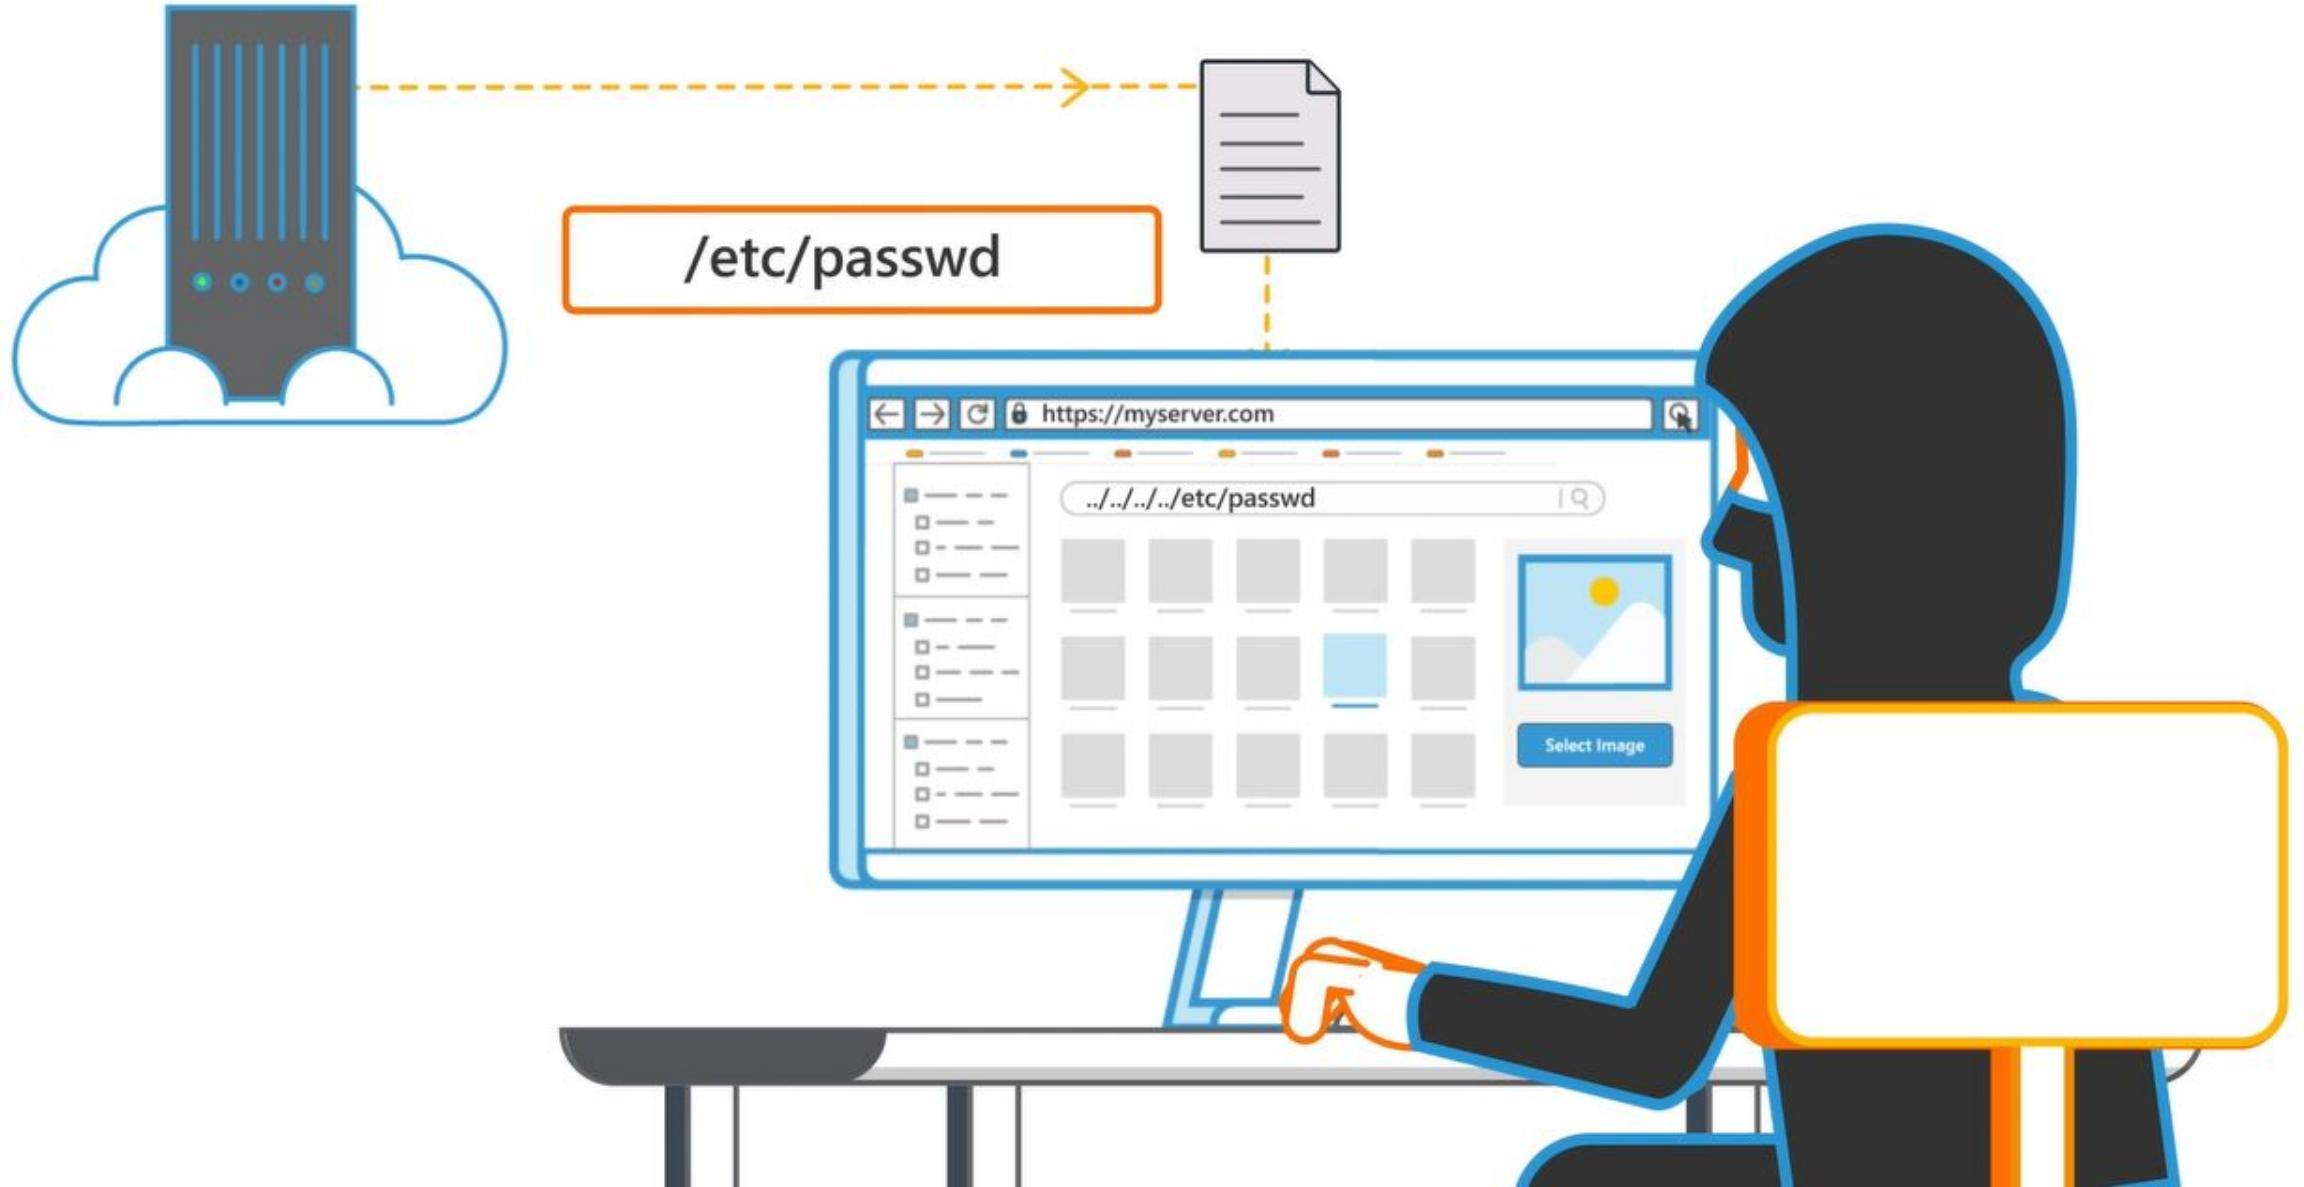

/var/www/myserver/images/../../../../../etc/passwd

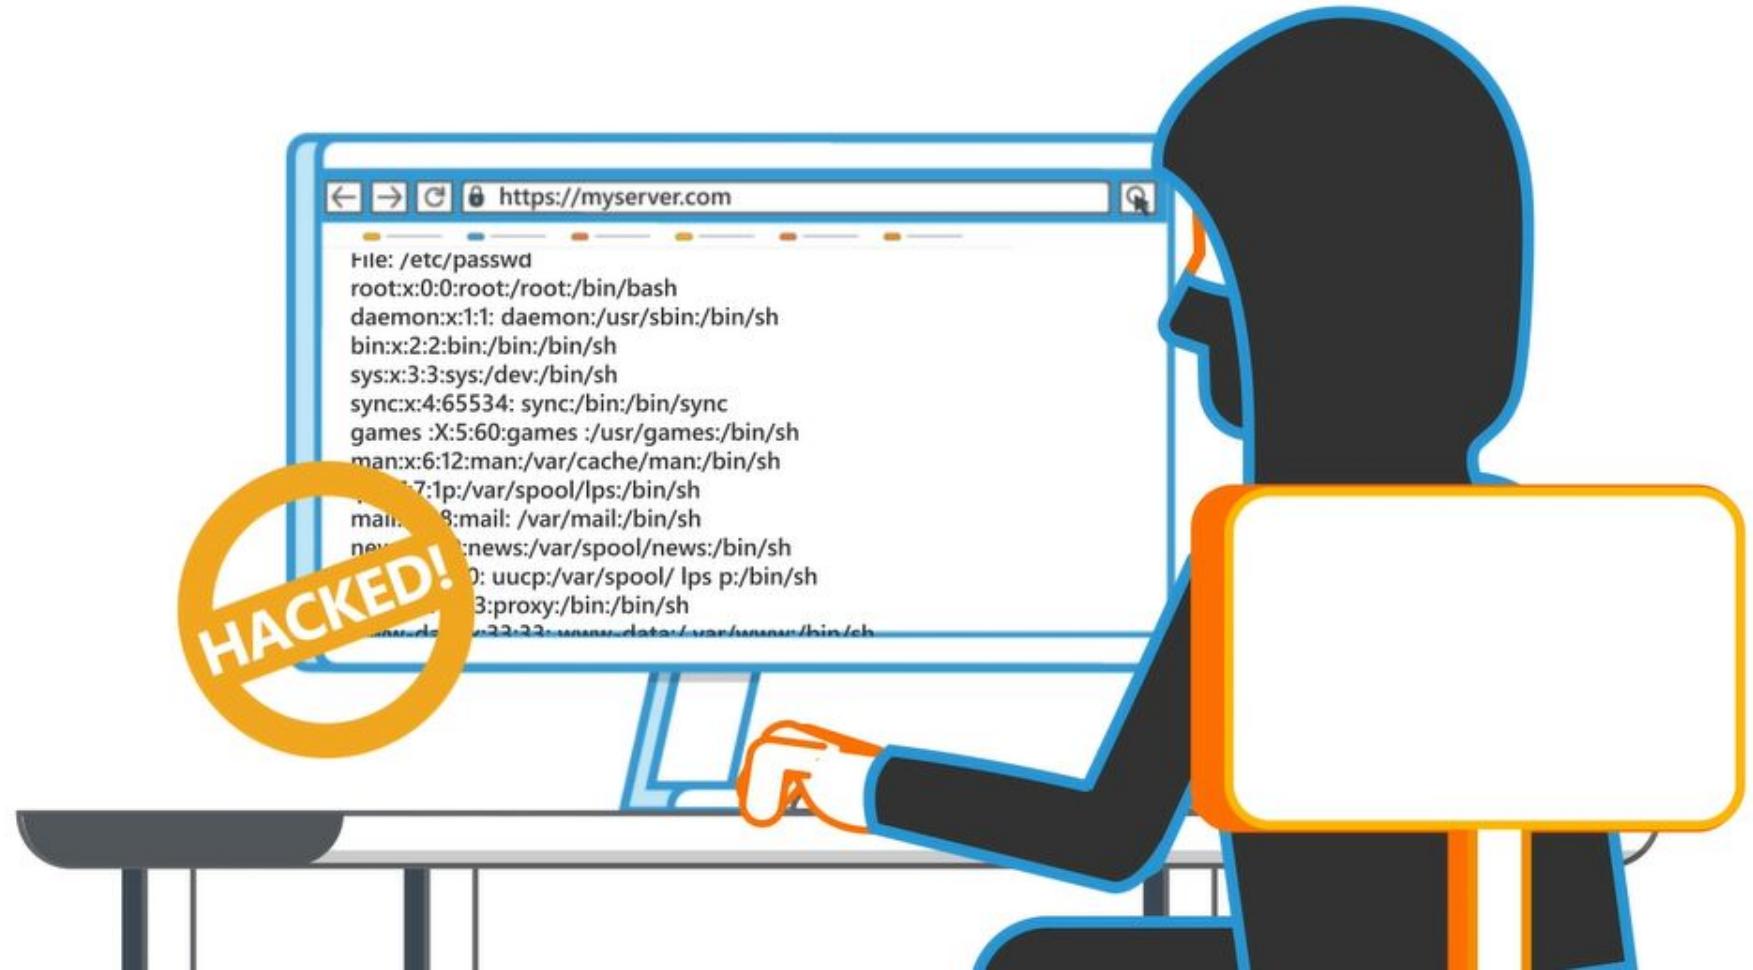

The four consecutive dot-dot-slash sequences moves the attacker up to the root filesystem.

So the file actually being read is: ...

That's how the attacker is able to see sensitive information.

```
File: /etc/passwd
root:x:0:0:root:/root:/bin/bash
daemon:x:1:1:daemon:/usr/sbin:/bin/sh
bin:x:2:2:bin:/bin:/bin/sh
sys:x:3:3:sys:/dev:/bin/sh
sync:x:4:65534:sync:/bin:/sync
games:X:5:60:games:/usr/games:/bin/sh
man:x:6:12:man:/var/cache/man:/bin/sh
lp:x:7:1:lp:/var/spool/lps:/bin/sh
mail:x:8:mail:/var/mail:/bin/sh
news:x:9:news:/var/spool/news:/bin/sh
uucp:x:10:uucp:/var/spool/lps/p:/bin/sh
proxy:x:13:proxy:/bin:/sh
```

---

## To prevent Path Traversal, developers should:

---

- ④ Test for path traversal vulnerabilities
- ④ Work without user input when using file system calls
- ④ Use indexes instead of parts of file names when templating or using language files

## To prevent Path Traversal, developers should:

- ④ Be sure that users are unable to supply all parts of the path
- ④ Use chrooted jails and code access policies to restrict unintended access and modification of files
- ④ When user input must be submitted for file operations, normalize the input before using in-file IO APIs

**Congratulations, you have now completed this module!**
